

Demonstration-02

Qualification: Web Application Development with Python L-4

Times: 2 hours 30 minute

Marks: 50

Project Specification:

Build a Django project for a To-Do list Application. Anyone can create their account into the application, and then users can create, update, and delete tasks. You need to create model to store the To-Do information. Define the fields for this model. Apply authentication (Login, Register, and Logout)

- After running the server opens Registration page. From this page user can register their account using these fields (username, full_name, email, password, confirm_password). This data will be store on the Custom User Model.
- Then form the login page can logged-in their account using the username and password.

Project setup:

- Project Name: todo_project
- App Name: tasks
- Model: TaskModel

Defining the Following fields for the Task Model:

- Title, description, status(Pending, InProgress, Completed, Canceled), due_date, created_at

****Note:** Apply Django form to create new and update task

Templates and Navigation:

Create a master template with the navigation links:

- **Register**
- **Login**
- **Logout**
- **Home:** Create a homepage to show welcome message with the username.
- **Add Task:** Form this page user can create their task
- **Task List:** Display all the tasks in a table with these columns: Title, Description, Due Date.
- **Task Details:** Implement a detail view to show individual task information.
